

Lab Session 11

String Handling Instructions

Primitive String Instructions

- The x86 instruction set has five groups of instructions for processing arrays of bytes, words, and double words.
- Each instruction implicitly uses ESI, EDI, or both registers to address memory.
- References to the accumulator imply the use of AL, AX, or EAX, depending on the instruction data size. String primitives execute efficiently because they automatically repeat and increment array indexes.

String Primitive Instructions.

Instruction	Description
MOVS _B , MOVSW, MOVSD	Move string data: Copy data from memory addressed by ESI to memory addressed by EDI.
CMPS _B , CMPSW, CMPSD	Compare strings: Compare the contents of two memory locations addressed by ESI and EDI.
SCAS _B , SCASW, SCASD	Scan string: Compare the accumulator (AL, AX, or EAX) to the contents of memory addressed by EDI.
STOS _B , STOSW, STOSD	Store string data: Store the accumulator contents into memory addressed by EDI.
LODS _B , LODSW, LODSD	Load accumulator from string: Load memory addressed by ESI into the accumulator.

1. MOVS_B, MOVSW, and MOVSD

The MOVS_B, MOVSW, and MOVSD instructions copy data from the memory location pointed to by ESI to the memory location pointed to by EDI. The two registers are either incremented or decremented automatically (based on the value of the Direction flag):

MOVS _B	Move (copy) bytes
MOVSW	Move (copy) words
MOVSD	Move (copy) doublewords

Using a Repeat Prefix

By itself, a string primitive instruction processes only a single memory value or pair of values. If you add a repeat prefix, the instruction repeats, using ECX as a counter. The repeat prefix permits you to process an entire array using a single instruction. The following repeat prefixes are used:

REP	Repeat while ECX > 0
REPZ, REPE	Repeat while the Zero flag is set and ECX > 0
REPNZ, REPNE	Repeat while the Zero flag is clear and ECX > 0

Example #1: Copy a String

In the following example, MOVSB moves 10 bytes from string1 to string2. The repeat prefix first tests ECX > 0 before executing the MOVSB instruction. If ECX = 0, the instruction is ignored and control passes to the next line in the program. If ECX > 0, ECX is decremented and the instruction repeats:

```
INCLUDE Irvine32.inc
.data

string1 BYTE 'this is first string',0
string2 BYTE 'this is second string',0

.code
main PROC
    cld      ; clear direction flag
    mov esi,OFFSET string1    ; ESI points to source
    mov edi,OFFSET string2    ; EDI points to target
    mov ecx,sizeof string1    ; set counter to 10
    rep movsb                  ; move bytes
    mov edx,offset string2    ; changed String
    call writestring
main ENDP
END main
```

ESI and EDI are automatically incremented when MOVSB repeats. This behavior is controlled by the CPU's Direction flag.

Direction Flag

String primitive instructions increment or decrement ESI and EDI based on the state of the Direction flag. The Direction flag can be explicitly modified using the CLD and STD instructions:

```
CLD      ; clear Direction flag (forward direction)
STD      ; set Direction flag (reverse direction)
```

Direction Flag Usage in String Primitive Instructions.

Value of the Direction Flag	Effect on ESI and EDI	Address Sequence
Clear	Incremented	Low-high
Set	Decrement	High-low

2. CMPSB, CMPSW, and CMPSD

The CMPSB, CMPSW, and CMPSD instructions each compare a memory operand pointed to by ESI to a memory operand pointed to by EDI. You can use a repeat prefix with CMPSB, CMPSW, and CMPSD. The Direction flag determines the incrementing or decrementing of ESI and EDI.

Example # 2: Comparing Doublewords

Suppose you want to compare a pair of double words using CMPSD. In the following example, source has a smaller value than target, so the JA instruction will not jump to label L1.

```
INCLUDE Irvine32.inc
.data

greater BYTE 'source > target',0
lessOrEqual BYTE 'source <target',0
source BYTE 'abcd',0
target BYTE 'abc',0

.code
main PROC
    mov esi,OFFSET source
    mov edi,OFFSET target
    cmpsd                    ; compare doublewords
    ja L1                    ; jump if source > target
    mov edx,offset lessOrEqual ;else print source <= target
    call writestring
    jmp endd
L1:
    mov edx,offset greater
    call writestring

endd:
exit
main ENDP
END main
```

3. SCASB, SCASW, and SCASD

The SCASB, SCASW, and SCASD instructions compare a value in AL/AX/EAX to a byte, word, or double word, respectively, addressed by EDI. The instructions are useful when looking for a single value in a string or array. Combined with the REPE (or REPZ) prefix, the string or array is scanned while ECX > 0 and the value in AL/ AX/ EAX match each subsequent value in memory. The REPNE prefix scans until either AL/AX/EAX matches a value in memory or ECX = 0.

Example #3: Scan for a Matching Character

```
INCLUDE Irvine32.inc
.data

alpha BYTE "ABCDEFGH",0

.code
main PROC
    mov edi,OFFSET alpha      ; EDI points to the string
    mov al,'F'                ; search for the letter F
    mov ecx,LENGTHOF alpha    ; set the search count
    cld                       ; direction = forward
    repne scasb               ; repeat while not equal
    jnz quit                  ; quit if letter not found
    dec edi                   ; found: back up EDI

quit:
    exit
main ENDP
END main
```

JNZ was added after the loop to test for the possibility that the loop stopped because ECX = 0 and the character in AL was not found.

4. STOSB, STOSW, and STOSD

The STOSB, STOSW, and STOSD instructions store the contents of AL/AX/EAX, respectively, in memory at the offset pointed to by EDI. EDI is incremented or decremented based on the state of the Direction flag. When used with the REP prefix, these instructions are useful for filling all elements of a string or array with a single value. For example, the following code initializes each byte in string1 to 0FFh:

```
.data
Count = 100
string1 BYTE Count DUP(?)
.code
    mov al,0FFh                ; value to be stored
    mov edi,OFFSET string1     ; EDI points to target
    mov ecx,Count              ; character count
    cld                        ; direction = forward
    rep stosb                  ; fill with contents of AL
```

5. LODSB, LODSW, and LODSD

The LODSB, LODSW, and LODSD instructions load a byte or word from memory at ESI into AL/AX/EAX, respectively. ESI is incremented or decremented based on the state of the Direction flag. The REP prefix is rarely used with LODS because each new value loaded into the accumulator overwrites its previous contents. Instead, LODS is used to load a single value. In the next example, LODSB substitutes for the following two instructions (assuming the Direction flag is clear):

```
mov al,[esi]      ; move byte into
inc esi           ; point to next byte
```

Example#4: Array Multiplication:

The following program multiplies each element of a doubleword array by a constant value. LODSD and STOSD work together:

```
TITLE Multiply an Array (Mult.asm)
;      This program multiplies each element of an array
;      of 32-bit integers by a constant value.
INCLUDE Irvine32.inc

.data
array DWORD 1,2,3,4,5,6,7,8,9,10      ; test data
multiplier DWORD 10                    ; test data

.code
main PROC
Cld                                     ; direction = forward
mov esi,OFFSET array                  ; source index
mov edi,esi                           ; destination index
mov ecx,LENGTHOF array                ; loop counter
L1:
Lodsd                                  ; load [ESI] into EAX
mul multiplier                         ; multiply by a value
Stosd                                  ; store EAX into [EDI]
loop L1
mov esi , OFFSET array
mov ecx, LENGTHOF array
mov ebx, TYPE array
call dumpmem                          ; updated array Display
Exit
main ENDP
END main
```

String Procedures

1. STR_COPY

The Str_copy procedure copies a null-terminated string from a source location to a target location.

Syntax: `INVOKE Str_copy, ADDR source, ADDR target`

2. STR_LENGTH

The Str_length procedure returns the length of a string in the EAX register. When you call it, pass the string's offset.

Syntax: `INVOKE Str_length, ADDR myString`

3. STR_COMPARE

The Str_compare procedure compares two strings. It affects the CF and ZF as shown in the following table.

Syntax: `INVOKE Str_compare, ADDR string1, ADDR string2`

4. Str_trim Procedure

The Str_trim procedure removes all occurrences of a selected trailing character from a null terminated string.

Syntax: `INVOKE Str_trim, ADDR string, char_to_trim`

5. Str_ucase Procedure

The Str_ucase procedure converts a string to all uppercase characters. It returns no value. When you call it, pass the offset of a string:

Syntax: `INVOKE Str_ucase, ADDR myString`

String Library Demo Program

```
INCLUDE Irvine32.inc
.data
string_1 BYTE "abcde////",0
string_2 BYTE "ABCDE",0
msg0 BYTE "string_1 in upper case: ",0
msg1 BYTE "string_1 and string_2 are equal",0
msg2 BYTE "string_1 is less than string_2",0
msg3 BYTE "string_2 is less than string_1",0
msg4 BYTE "Length of string_2 is ",0
msg5 BYTE "string_1 after trimming: ",0
.code
main PROC
    call trim_string
```

```
call upper_case
call compare_strings
call print_length
exit
main ENDP
```

```
trim_string PROC
```

```
                ; Remove trailing characters from string_1.
```

```
INVOKE Str_trim, ADDR string_1, '/'
```

```
mov edx,OFFSET msg5
```

```
call WriteString
```

```
mov edx,OFFSET string_1
```

```
call WriteString
```

```
call CrLf
```

```
ret
```

```
trim_string ENDP
```

```
upper_case PROC
```

```
                ; Convert string_1 to upper case.
```

```
mov edx,OFFSET msg0
```

```
call WriteString
```

```
INVOKE Str_ucase, ADDR string_1
```

```
mov edx,OFFSET string_1
```

```
call WriteString
```

```
call CrLf
```

```
ret
```

```
upper_case ENDP
```

```
compare_strings PROC
```

```
                ; Compare string_1 to string_2.
```

```
INVOKE Str_compare, ADDR string_1, ADDR string_2
```

```
.IF ZERO?
```

```
mov edx,OFFSET msg1
```

```
.ELSEIF CARRY?
```

```
mov edx,OFFSET msg2                ; string 1 is less than...
```

```
.ELSE
```

```
mov edx,OFFSET msg3                ; string 2 is less than...
```

```
.ENDIF
```

```
call WriteString
```

```
call CrLf
```

```
ret
```

```
compare_strings ENDP
```

```
print_length PROC
```

```
                ; Display the length of string_2.
```

```
mov edx,OFFSET msg4
```

```
call WriteString
INVOKE Str_length, ADDR string_2
call WriteDec
call Crlf
ret
print_length ENDP
END main
```

Exercise

1. Write a program to find the index(location) of the first occurrence of the character '#' in the given string.

```
Str1 BYTE '127&j~3#^&***#45^',0
```

2. Repeat the task 1 by creating a procedure named scan_char. Call the procedure to find the index(location) of the first occurrence of the character '#' in the given string.

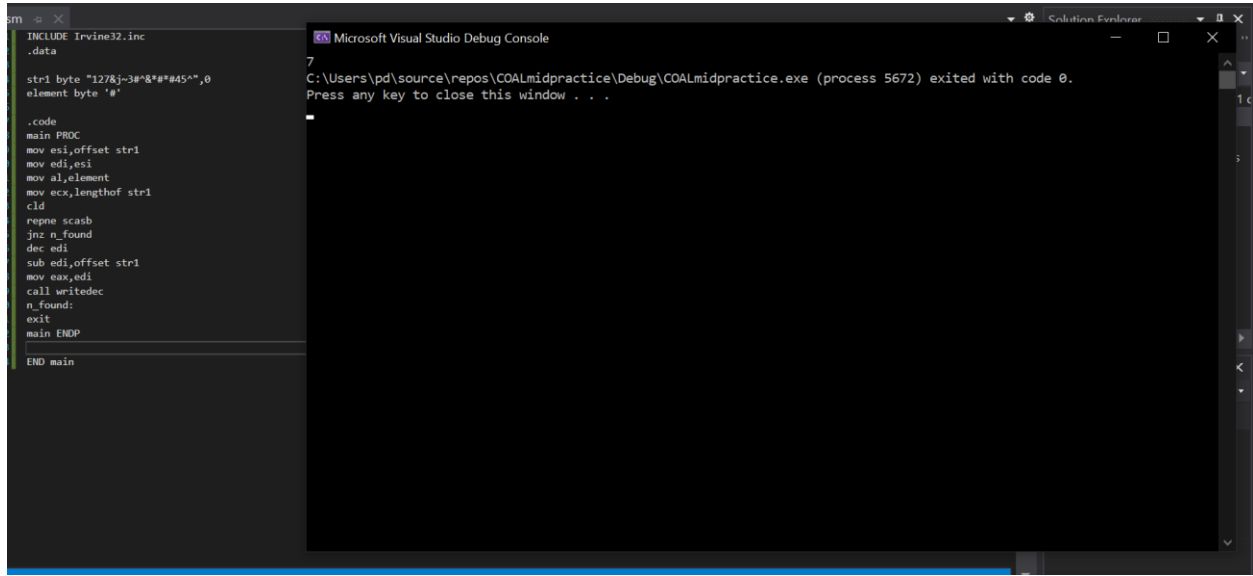

3. Create IsCompare procedure to compare two strings.

4. Create *Move* procedure to perform move operation on two strings.

5. Create a Str_Reverse procedure to reverse strings.

6. Create a procedure that Loads an array of integer by multiplying it with 3. Display updated Array.

TASK 1:

The screenshot shows the Visual Studio IDE with an assembly file named `asm.asm` open. The code defines a string `str1` with the value `"127&j-3#*-^",0` and a single byte element `'#'`. The `main` procedure uses `scasd` to scan for the character `'#'` in the string. The `Debug Console` shows the program exiting with code 0.

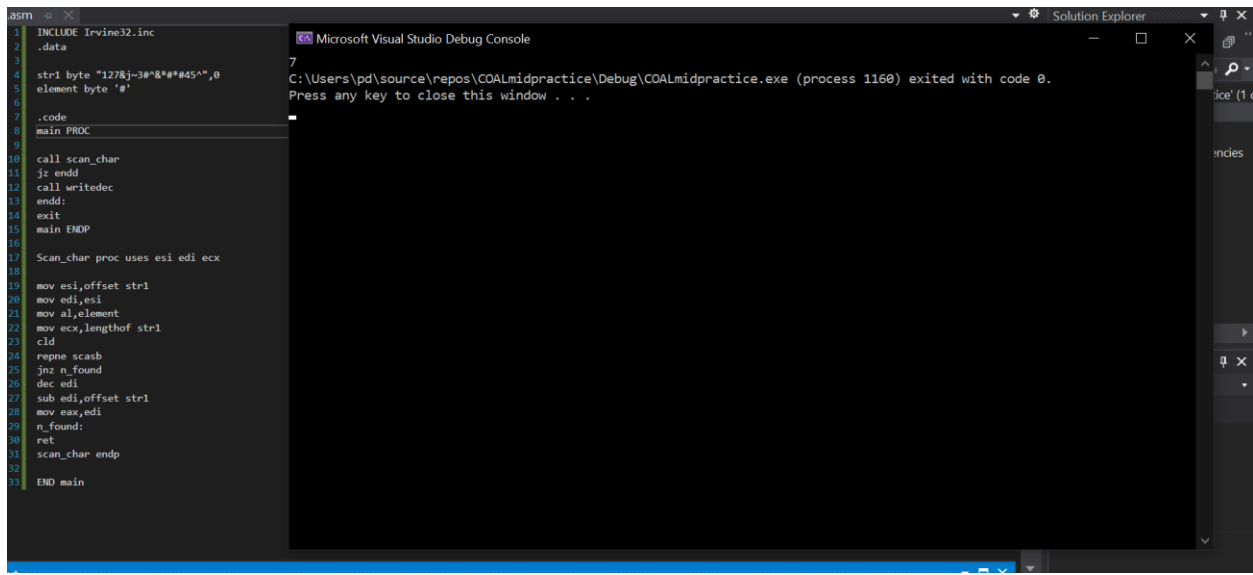

```
asm.asm
INCLUDE Irvine32.inc
.data
str1 byte "127&j-3#*&#45^",0
element byte '#'

.code
main PROC
    mov esi,offset str1
    mov edi,esi
    mov al,element
    mov ecx,lengthof str1
    cld
    repne scasd
    jnz n_found
    dec edi
    sub edi,offset str1
    mov eax,edi
    call writedec
n_found:
    exit
main ENDP
END main
```

Microsoft Visual Studio Debug Console

```
7
C:\Users\pd\source\repos\COALmidpractice\Debug\COALmidpractice.exe (process 5672) exited with code 0.
Press any key to close this window . . .
```

TASK 2:

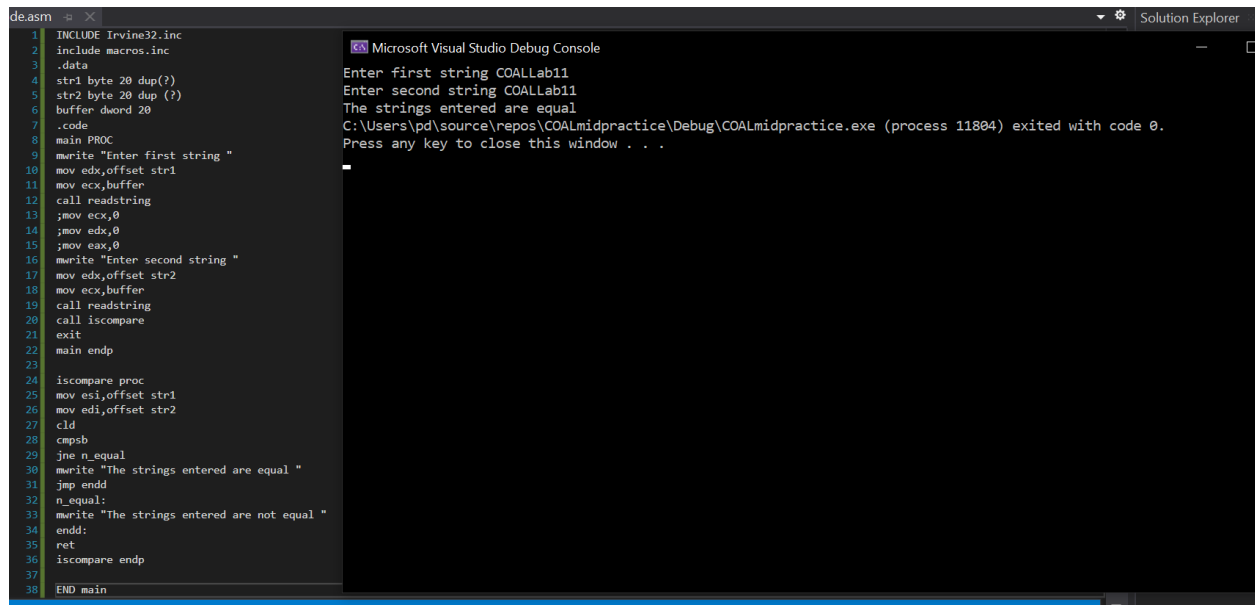

The screenshot shows the Visual Studio IDE with an assembly file named `asm.asm` open. The code defines a string `str1` with the value `"127&j-3#*-^",0` and a single byte element `'#'`. The `main` procedure calls `scan_char` to find the character `'#'` in the string. The `Debug Console` shows the program exiting with code 0.

```
asm.asm
1 INCLUDE Irvine32.inc
2 .data
3 str1 byte "127&j-3#*&#45^",0
4 element byte '#'
5
6 .code
7 main PROC
8
9
10 call scan_char
11 jz endd
12 call writedec
13 endd:
14 exit
15 main ENDP
16
17 Scan_char proc uses esi edi ecx
18
19 mov esi,offset str1
20 mov edi,esi
21 mov al,element
22 mov ecx,lengthof str1
23 cld
24 repne scasd
25 jnz n_found
26 dec edi
27 sub edi,offset str1
28 mov eax,edi
29 n_found:
30 ret
31 scan_char endp
32
33 END main
```

Microsoft Visual Studio Debug Console

```
7
C:\Users\pd\source\repos\COALmidpractice\Debug\COALmidpractice.exe (process 1160) exited with code 0.
Press any key to close this window . . .
```

TASK 3:

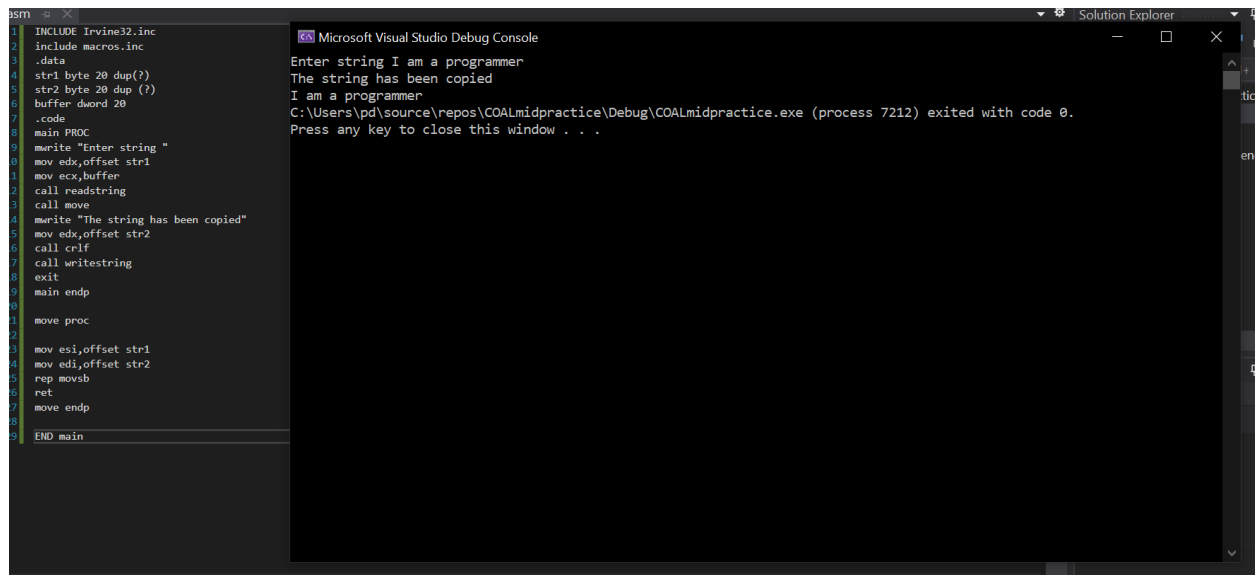

The screenshot shows the Visual Studio IDE with the assembly file `de.asm` open on the left and the Microsoft Visual Studio Debug Console on the right. The assembly code defines a program that prompts for two strings and compares them. The debug console shows the program's execution, including the prompts, user input, and the final exit message.

```
1 INCLUDE Irvine32.inc
2 include macros.inc
3 .data
4 str1 byte 20 dup(?)
5 str2 byte 20 dup(?)
6 buffer dword 20
7 .code
8 main PROC
9     mwrite "Enter first string "
10    mov edx,offset str1
11    mov ecx,buffer
12    call readstring
13    ;mov ecx,0
14    ;mov edx,0
15    ;mov eax,0
16    mwrite "Enter second string "
17    mov edx,offset str2
18    mov ecx,buffer
19    call readstring
20    call iscompare
21    exit
22 main endp
23
24 iscompare proc
25 mov esi,offset str1
26 mov edi,offset str2
27 cld
28 cmpsb
29 jne n_equal
30 mwrite "The strings entered are equal "
31 jmp endd
32 n_equal:
33 mwrite "The strings entered are not equal "
34 endd:
35 ret
36 iscompare endp
37
38 END main
```

Microsoft Visual Studio Debug Console

Enter first string COALLab11
Enter second string COALLab11
The strings entered are equal
C:\Users\pd\source\repos\COALmidpractice\Debug\COALmidpractice.exe (process 11804) exited with code 0.
Press any key to close this window . . .

TASK 4:

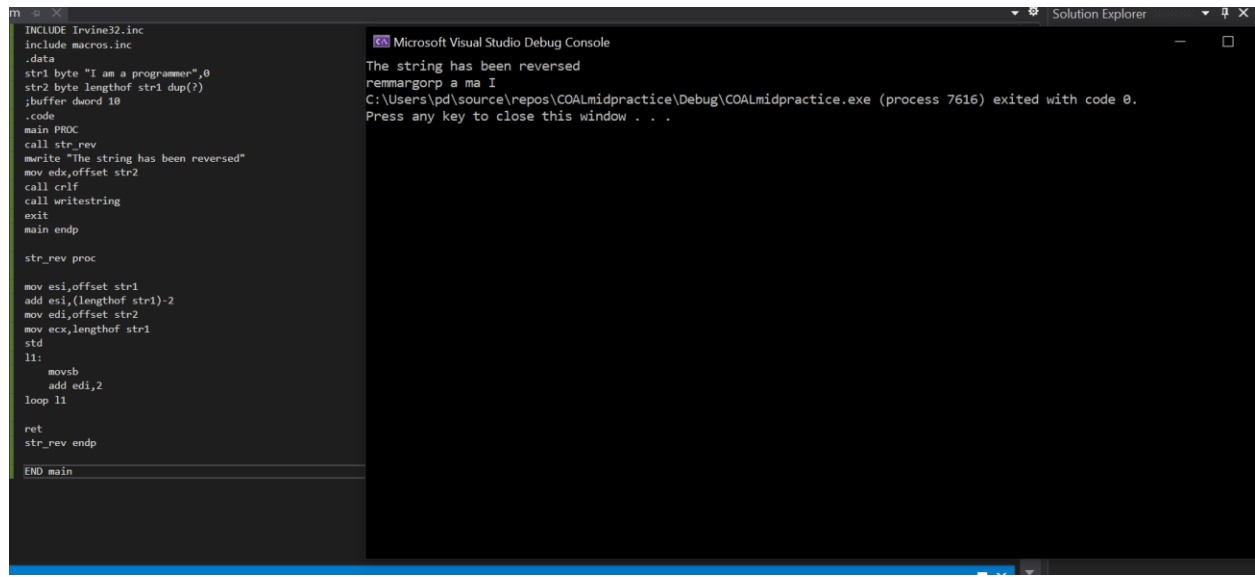

The screenshot shows the Visual Studio IDE with the assembly file `asm` open on the left and the Microsoft Visual Studio Debug Console on the right. The assembly code defines a program that prompts for a string and copies it. The debug console shows the program's execution, including the prompt, user input, and the final exit message.

```
1 INCLUDE Irvine32.inc
2 include macros.inc
3 .data
4 str1 byte 20 dup(?)
5 str2 byte 20 dup(?)
6 buffer dword 20
7 .code
8 main PROC
9     mwrite "Enter string "
10    mov edx,offset str1
11    mov ecx,buffer
12    call readstring
13    call move
14    mwrite "The string has been copied"
15    mov edx,offset str2
16    call crlf
17    call writestring
18    exit
19 main endp
20
21 move proc
22 mov esi,offset str1
23 mov edi,offset str2
24 rep movsb
25 ret
26 move endp
27
28 END main
```

Microsoft Visual Studio Debug Console

Enter string I am a programmer
The string has been copied
I am a programmer
C:\Users\pd\source\repos\COALmidpractice\Debug\COALmidpractice.exe (process 7212) exited with code 0.
Press any key to close this window . . .

TASK 5:

The screenshot shows the Visual Studio IDE with an assembly file open on the left and the Microsoft Visual Studio Debug Console on the right. The assembly code defines a string "I am a programmer", reverses it, and prints the result. The debug console shows the output of the program.

```
INCLUDE Irvine32.inc
include macros.inc
.data
str1 byte "I am a programmer",0
str2 byte lengthof str1 dup(?)
;buffer dword 10
.code
main PROC
call str_rev
mwrite "The string has been reversed"
mov edx,offset str2
call crlf
call writestring
exit
main endp

str_rev proc

mov esi,offset str1
add esi,(lengthof str1)-2
mov edi,offset str2
mov ecx,lengthof str1
std
l1:
movsb
add edi,2
loop l1

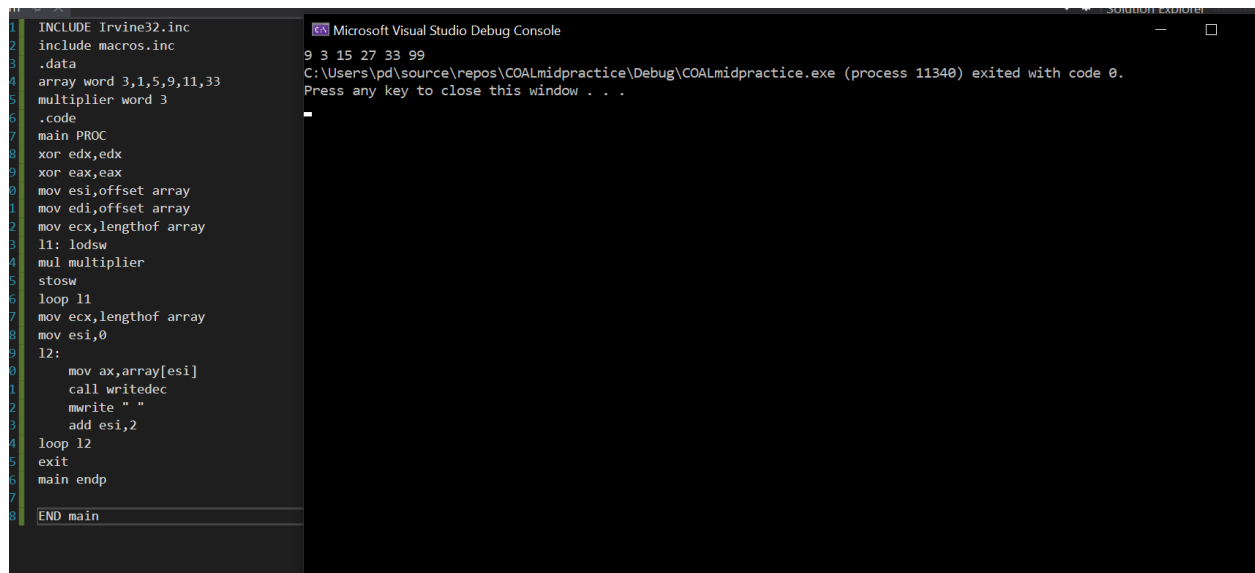

ret
str_rev endp

END main
```

Microsoft Visual Studio Debug Console

The string has been reversed
remmargorp a ma I
C:\Users\pd\source\repos\COALmidpractice\Debug\COALmidpractice.exe (process 7616) exited with code 0.
Press any key to close this window . . .

TASK 6:

The screenshot shows the Visual Studio IDE with an assembly file open on the left and the Microsoft Visual Studio Debug Console on the right. The assembly code defines an array of numbers, multiplies each element by a multiplier, and prints the result. The debug console shows the output of the program.

```
1 INCLUDE Irvine32.inc
2 include macros.inc
3 .data
4 array word 3,1,5,9,11,33
5 multiplier word 3
6 .code
7 main PROC
8 xor edx,edx
9 xor eax,eax
10 mov esi,offset array
11 mov edi,offset array
12 mov ecx,lengthof array
13 l1: lodsw
14 mul multiplier
15 stosw
16 loop l1
17 mov ecx,lengthof array
18 mov esi,0
19 l2:
20 mov ax,array[esi]
21 call writedec
22 mwrite " "
23 add esi,2
24 loop l2
25 exit
26 main endp
27
28 END main
```

Microsoft Visual Studio Debug Console
